

# **Trigonometry Concepts & Vocab**

Updated March 2020

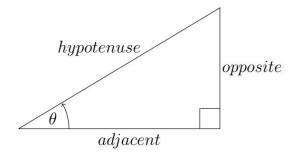

**Key Definition and Properties of the Trigonometric Functions** 

# Definition of a Right Triangle

### **Key Vocabulary**

Assume that  $0<\theta<(\pi/2)$  or  $0^{\circ}<\theta<90^{\circ}$ 

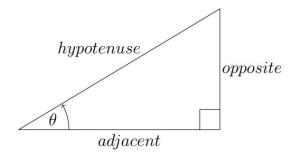

- → Hypotenuse: side opposite the right angle and the longest side of the triangle
- $\rightarrow$  Opposite: side opposite  $\theta$
- $\rightarrow$  Adjacent: non-hypotenuse side next to  $\theta$

# Definition of a Right Triangle

### **Key Vocabulary**

Assume that  $0<\theta<(\pi/2)$  or  $0^{\circ}<\theta<90^{\circ}$ 

- Sine:  $\sin \theta = \text{opp / hyp}$
- → Cosine:  $\cos \theta = \text{adj / hyp}$
- → Tangent: tan  $\theta$  = opp / adj
- **Cosecant:**  $\csc \theta = \text{hyp / opp} = 1 / \text{sine}$
- **Secant:** sec  $\theta$  = hyp / adj = 1 / cosine
- **Cotangent:** cot  $\theta$  = adj / opp = 1 / tangent

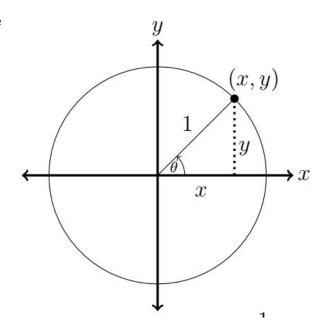

# Definition of the Unit Circle

## **Key Vocabulary**

Assume  $\theta$  can be any angle

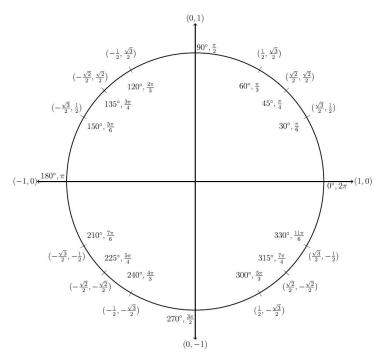

- $\rightarrow$  sin  $\theta = y / 1$
- $\rightarrow$  cos  $\theta = x / 1$
- $\rightarrow$  tan  $\theta = y / x$
- $\rightarrow$  csc  $\theta = 1/y$
- $\rightarrow$  sec  $\theta = 1/x$
- $\rightarrow$  cot  $\theta = x / y$

# Definition of the Unit Circle

## **Key Vocabulary**

For any ordered pair on the unit circle (x,y):  $x = \cos \theta$  and  $y = \sin \theta$ 

# Degrees and Radians

### **Key Vocabulary**

Angles can be measured using degrees or radians.

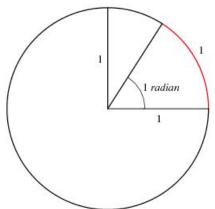

A **radian** is the measure of the angle that cuts off an arc of length 1 on the unit circle

If x is an angle in degrees, and t is an angle in radians, then:

$$\rightarrow$$
  $\pi / 180^\circ = t / x$ 

→ 
$$t = (\pi x) / 180^{\circ}$$

→ 
$$x = (180^{\circ}t) / \pi$$

Commonly used angles in degrees and radians:

Deg:	0°	30°	45°	60°	90°	120°	135°	150°	180°
Rad:	0	π/6	π/4	π/3	π/2	2π/3	3π/4	5π/6	π

Deg:	180°	210°	225°	240°	270°	300°	315°	330°	360°
Rad:	π	7π/6	5π/4	4π/3	3π/2	5π/3	$7\pi/4$	11π/6	2π

# Domains of the Trig Functions

### **Key Property**

**Domain:** the set of all possible values of the **independent** variable ( $\theta$  below)

Domains of the trig functions:

- $\rightarrow$  sin  $\theta$ :  $\forall \theta \in (-\infty,\infty)$
- $\rightarrow$  cos  $\theta$ :  $\forall \theta \in (-\infty, \infty)$
- → tan θ:  $\forall$  θ ≠ (k+½) $\pi$ , where k∈ $\mathbb{Z}$
- → csc θ:  $\forall$  θ ≠ kπ, where k∈ $\mathbb{Z}$
- → sec θ:  $\forall$  θ ≠ (k+½) $\pi$ , where k∈ $\mathbb{Z}$
- → cot θ:  $\forall$  θ ≠ kπ, where k∈ $\mathbb{Z}$

#### Symbol definitions:

- → **∀**: for all
- **→ ∈**: in
- → Z: set of all integers

# Ranges of the Trig Functions

### **Key Property**

**Range:** the set of all possible values of the **dependent** variable after substituting the domain

Ranges of the trig functions:

- →  $-1 \le \sin \theta \le 1$
- →  $-1 \le \cos \theta \le 1$
- →  $-\infty \le \tan \theta \le \infty$
- ⇒ csc  $\theta \ge 1$  and csc  $\theta \le -1$
- ⇒ sec  $\theta \ge 1$  and sec  $\theta \le -1$
- →  $-\infty \le \cot \theta \le \infty$

# Periods of the Trig Functions

### **Key Property**

**Period:** The distance required for the function to complete one full cycle. It is the number, T, such that  $f(\theta + T) = f(\theta)$ 

Let k be a fixed number and  $\theta$  be any angle. Then the periods of the trig functions are:

$$\rightarrow$$
 sin (k $\theta$ ): T = 2 $\pi$  / k

$$\rightarrow$$
 csc (k $\theta$ ): T = 2 $\pi$  / k

$$\rightarrow$$
 cos (k $\theta$ ): T = 2 $\pi$  / k

$$\rightarrow$$
 sec (k $\theta$ ): T = 2 $\pi$  / k

$$\rightarrow$$
 tan (k $\theta$ ): T =  $\pi$  / k

$$\rightarrow$$
 cot (k $\theta$ ): T =  $\pi$  / k

#### **Periodic Formulas**

Let n be an integer. Then,

$$\Rightarrow$$
 sin (θ + 2πn) = sin θ

$$\rightarrow$$
 csc  $(\theta + 2\pi n) = csc \theta$ 

$$\rightarrow$$
 cos (θ + 2πn) = cos θ

$$\rightarrow$$
 sec (θ + 2πn) = sec θ

$$\rightarrow$$
 tan  $(\theta + \pi n) = \tan \theta$ 

$$\rightarrow$$
 cot  $(\theta + \pi n) = \cot \theta$ 

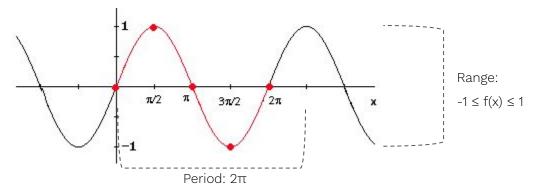

# Graphs of the Trigonometric Functions

# Graphs of the Trig Functions

### Sine Graph

The below graph shows the function  $f(x) = \sin(x)$ 

#### **Key Properties**

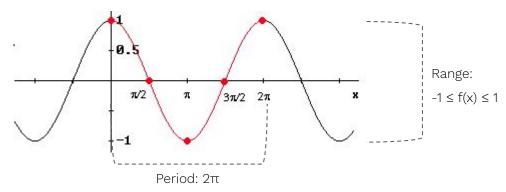

- → Domain:  $-\infty \le x \le \infty$
- $\rightarrow$  Range:  $-1 \le f(x) \le 1$
- $\rightarrow$  Period:  $2\pi$
- $\rightarrow$  x-intercept: x = k $\pi$ , where k is an integer
- → y-intercept: y = 0
- $\rightarrow$  Maximum:  $(\pi/2 + 2k\pi, 1)$ , where k is an integer
- $\rightarrow$  Minimum:  $(3\pi / 2 + 2k\pi, -1)$ , where k is an integer

# Graphs of the Trig Functions

### **Cosine Graph**

The below graph shows the function f(x) = cos(x)

#### **Key Properties**

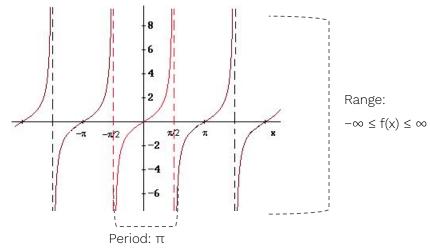

- → Domain:  $-\infty \le x \le \infty$
- $\rightarrow$  Range:  $-1 \le f(x) \le 1$
- $\rightarrow$  Period:  $2\pi$
- $\rightarrow$  x-intercept:  $x = \pi/2 + k\pi$ , where k is an integer
- → y-intercept: y = 1
- $\rightarrow$  Maximum: (2k $\pi$ , 1), where k is an integer
- $\rightarrow$  Minimum:  $(\pi + 2k\pi, -1)$ , where k is an integer

# Graphs of the Trig Functions

### Tangent Graph

The below graph shows the function f(x) = tan(x)

#### **Key Properties**

- → Domain:  $\forall x \neq (k+\frac{1}{2})\pi$ , where k is an integer
- $\rightarrow$  Range:  $-\infty \le f(x) \le \infty$
- → Period: π
- $\rightarrow$  x-intercept: x = k $\pi$ , where k is an integer
- → y-intercept: y = 0

**Key Identities and Formula of the Trigonometric Functions** 

# Tangent and Reciprocal Identities

## **Key Identities**

Tangent and Cotangent Identities

- $\rightarrow$  tan  $\theta = \sin \theta / \cos \theta$
- $\rightarrow$  cot  $\theta = \cos \theta / \sin \theta$

#### Reciprocal Identities

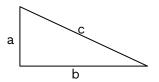

- $\rightarrow$  sin  $\theta = 1 / \csc \theta$
- $\rightarrow$  cos  $\theta = 1 / \sec \theta$
- $\rightarrow$  tan  $\theta = 1 / \cot \theta$
- $\rightarrow$  csc  $\theta = 1 / \sin \theta$
- $\rightarrow$  sec  $\theta = 1/\cos \theta$
- $\rightarrow$  cot  $\theta = 1 / \tan \theta$

## Pythagorean Theorem and Identities

### Key Formulas

#### **Pythagorean Theorem**

→ Let a, b and c be the lengths of the sides of a right triangle (where c is the length of the hypotenuse). Then  $a^2 + b^2 = c^2$ 

#### Pythagorean Identities

$$\rightarrow$$
  $\sin^2 \theta + \cos^2 \theta = 1$ 

$$\rightarrow$$
 tan<sup>2</sup>  $\theta$  + 1 = sec<sup>2</sup>  $\theta$ 

$$\rightarrow$$
 1 + cot<sup>2</sup>  $\theta$  = csc<sup>2</sup>  $\theta$ 

#### Pythagorean Triples

- A pythagorean triple is any set of three positive integers (a,b,c) such that  $a^2 + b^2 = c^2$
- → Common pythagorean triples include: (3,4,5), (6,8,10), (5,12,13), (8,15,17)
- → If (a,b,c) is a Pythagorean triple, then so is (ka, kb, kc) for any positive integer k

## **Even and Odd**

## **Key Formulas**

Even and Odd Formulas

$$\rightarrow$$
 sin  $(-\theta) = -\sin \theta$ 

$$\rightarrow$$
  $\cos(-\theta) = \cos\theta$ 

$$\rightarrow$$
 tan  $(-\theta) = - \tan \theta$ 

$$\rightarrow$$
 csc  $(-\theta) = - \csc \theta$ 

$$\rightarrow$$
 sec  $(-\theta)$  = sec  $\theta$ 

$$\rightarrow$$
 cot  $(-\theta) = -\cot \theta$ 

# Double Angle and Half Angle

## **Key Formulas**

Double Angle Formulas

$$\rightarrow$$
 sin (2θ) = 2 sin θ cos θ

$$\rightarrow$$
 cos (2θ) = cos<sup>2</sup> θ - sin<sup>2</sup> θ = 2 cos<sup>2</sup> θ - 1 = 1 - 2 sin<sup>2</sup> θ

$$\Rightarrow \tan (2\theta) = \frac{2 \tan \theta}{1 - \tan^2 \theta}$$

Half Angle Formulas

$$\Rightarrow \quad \sin\left(\theta/2\right) = \pm \sqrt{\frac{1 - \cos(2\theta)}{2}}$$

$$\Rightarrow \quad \cos(\theta/2) = \pm \sqrt{\frac{1 + \cos(2\theta)}{2}}$$

$$\Rightarrow \tan (\theta/2) = \pm \sqrt{\frac{1 - \cos(2\theta)}{1 + \cos(2\theta)}}$$

# Sum, Difference, and Product

### Key Formulas

#### Sum and Difference

- $\rightarrow$   $\sin (\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$
- $\rightarrow$   $\cos (\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$
- $\Rightarrow$  tan  $(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$

#### Product to Sum Formulas

- $\rightarrow$  sin  $\alpha$  sin  $\beta = \frac{1}{2} [\cos(\alpha \beta) \cos(\alpha + \beta)]$
- $\rightarrow$  cos  $\alpha$  cos  $\beta$  =  $\frac{1}{2}$  [cos( $\alpha$   $\beta$ ) + cos( $\alpha$  +  $\beta$ )]
- $\rightarrow$  sin  $\alpha$  cos  $\beta$  =  $\frac{1}{2}$  [sin  $(\alpha + \beta) + \sin(\alpha \beta)$ ]
- $\rightarrow$  cos  $\alpha$  sin  $\beta = \frac{1}{2} [\sin (\alpha + \beta) \sin(\alpha \beta)]$

#### Sum to Product Formulas

- $\rightarrow$  sin  $\alpha$  + sin  $\beta$  = 2 sin ( $\alpha$ /2 +  $\beta$ /2) cos ( $\alpha$ /2  $\beta$ /2)
- $\rightarrow$  sin  $\alpha$  sin  $\beta$  = 2 cos ( $\alpha/2 + \beta/2$ ) sin ( $\alpha/2 \beta/2$ )
- $\rightarrow$  cos  $\alpha$  + cos  $\beta$  = 2 cos ( $\alpha$ /2 +  $\beta$ /2) cos( $\alpha$ /2  $\beta$ /2)
- $\rightarrow$  cos  $\alpha$  cos  $\beta$  = 2 sin ( $\alpha/2 + \beta/2$ ) sin( $\alpha/2 \beta/2$ )

## Cofunctions

## **Key Formulas**

Cofunction Formulas

- $\rightarrow$  sin  $(\pi/2 \theta) = \cos \theta$
- $\rightarrow$  cos  $(\pi/2 \theta) = \sin \theta$
- $\rightarrow$  csc  $(\pi/2 \theta) = \sec \theta$
- $\rightarrow$  sec  $(\pi/2 \theta) = \csc \theta$
- $\rightarrow$  tan  $(\pi/2 \theta) = \cot \theta$
- $\rightarrow$  cot  $(\pi/2 \theta) = \tan \theta$

**Inverse Trig Functions** 

# Definition of the inverse trig functions

### **Key Vocabulary**

Definition of the inverse trig functions

- $\rightarrow$   $\theta = \sin^{-1}(x)$  is equivalent to  $x = \sin \theta$
- $\rightarrow$   $\theta = \cos^{-1}(x)$  is equivalent to  $x = \cos \theta$
- $\rightarrow$   $\theta = \tan^{-1}(x)$  is equivalent to  $x = \tan \theta$

The inverse trig functions can also be notated as

- $\rightarrow$  sin<sup>-1</sup>(x) = arcsin(x)
- $\rightarrow$  cos<sup>-1</sup>(x) = arccos(x)
- $\rightarrow$  tan<sup>-1</sup>(x) = arctan(x)

# Key properties of the inverse trig functions

## **Key Properties**

Domain and range of the inverse trig functions

Function	Domain	Range		
$\theta = \sin^{-1}(x)$	-1 ≤ x ≤ 1	$-\pi/2 \le \theta \le \pi/2$		
$\theta = \cos^{-1}(x)$	-1 ≤ x ≤ 1	$0 \le \theta \le \pi$		
$\theta = tan^{-1}(x)$	$-\infty \le X \le \infty$	-π/2 ≤ <b>θ</b> ≤ π/2		

The following properties hold for x in the domain and  $\boldsymbol{\theta}$  in the range

- $\rightarrow$  sin(sin<sup>-1</sup>(x)) = x
- $\rightarrow$  cos(cos<sup>-1</sup>(x)) = x
- $\rightarrow$  tan(tan<sup>-1</sup>(x)) = x
- $\rightarrow$   $\sin^{-1}(\sin(\theta)) = \theta$
- $\rightarrow$   $\cos^{-1}(\cos(\theta)) = \theta$
- $\rightarrow$   $\cos^{-1}(\cos\theta)) = \theta$

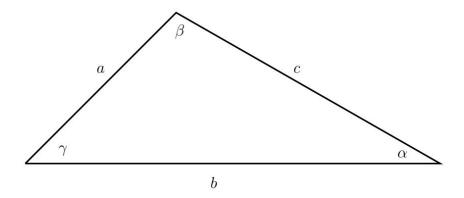

Laws of Sines, Cosines, and Tangents

# **Law of Sines**

## **Key Vocabulary**

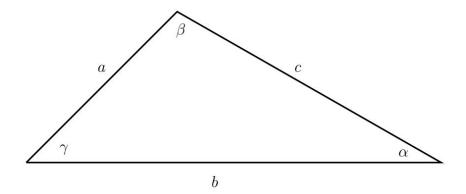

Law of Sines

$$\rightarrow$$
 (sin  $\alpha$ ) / a = (sin  $\beta$ ) / b = (sin  $\gamma$ ) / c

# **Law of Cosines**

## **Key Vocabulary**

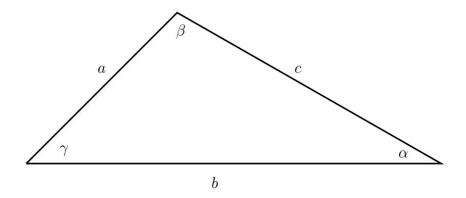

#### Law of Cosines

- →  $a^2 = b^2 + c^2 2bc$  (cos α)
- ⇒  $b^2 = a^2 + c^2 2ac (cos \beta)$
- →  $c^2 = a^2 + b^2 2ab (\cos \gamma)$

# **Law of Tangents**

## **Key Vocabulary**

#### Law of Tangents

$$\frac{a-b}{a+b} = \frac{\tan \frac{1}{2} (\alpha - \beta)}{\tan \frac{1}{2} (\alpha + \beta)}$$

$$b - c = \tan \frac{1}{2} (\beta - \gamma)$$

$$b + c = \tan \frac{1}{2} (\beta + \gamma)$$

$$\frac{a-b}{a+c} = \frac{\tan \frac{1}{2} (\alpha - \gamma)}{\tan \frac{1}{2} (\alpha + \gamma)}$$

**Complex Numbers and DeMoivre's Theorem** 

# Definition of a complex number

### **Key Vocabulary**

Definition of the **imaginary number** *i* 

$$\rightarrow$$
  $i = \sqrt{(-1)}$ 

→ 
$$i^2 = -1$$

$$\rightarrow$$
  $i^3 = -i$ 

$$\rightarrow$$
  $i^4 = 1$ 

A **complex number** is a combination of a real number and an imaginary number and can be written in the form a + bi, where a and b are real numbers

The **conjugate** of a complex number a + bi, denoted a + bi is given by

$$\rightarrow$$
  $a + bi = a - bi$ 

The absolute value of a complex number, or **complex modulus** is given by

$$\Rightarrow |\mathbf{a} + \mathbf{b}i| = a^2 + b^2$$

# DeMoivre's Theorem

#### DeMoivre's Theorem

Let  $z = r(\cos \theta + i \sin \theta)$  and let n be a positive integer. Then:

$$z^n = r^n (\cos n\theta + i \sin n\theta)$$

**Example:** Let z = 1 - i, find  $z^6$ 

First write z in polar form

- The polar form of a complex number x + yi is given by:  $r(\cos \theta + i \sin \theta)$
- $\rightarrow$   $r = \sqrt{(1)^2 + (-1)^2} = \sqrt{2}$
- $\rightarrow$   $\theta = arg(z) = tan^{-1}(-1/1) = -\pi/4$
- $\rightarrow$  Polar form:  $z = \sqrt{2} \left[ \cos(-\pi/4) + i \sin(-\pi/4) \right]$

Applying DeMoivre's Theorem gives:

$$z^{6} = (\sqrt{2})^{6} \left[\cos(6 \times (-\pi/4)) + i \sin(6 \times (-\pi/4))\right]$$

$$= 2^{3} \left[\cos(-3\pi/2) + i \sin(-3\pi/2)\right]$$

$$= 8 \left[0 + i(1)\right]$$

$$= 8i$$

# DeMoivre's Theorem

# Finding the *nth* roots of a number using DeMoivre's Theorem

**Example:** Find all the complex fourth roots of 4. That is, find all the complex solutions of  $x^4 = 4$ 

For any positive integer n, a nonzero complex number z has exactly n distinct nth roots. If z is written in the trigonometric form r ( $\cos \theta + i \sin \theta$ ), the nth roots of z are given by the following formula:

(\*) 
$$r^{1/n} [\cos(\theta/n + 360^{\circ}k/n) + i \sin(\theta/n + 360^{\circ}k/n)], \text{ for } k = 0, 1, 2, ..., n-1$$

Writing the number 4 in trigonometric form using  $r = \sqrt{a^2 + b^2}$  and  $\theta = \arg(z) = \tan^{-1}(b/a)$ , we have the following:

→ 
$$4 = 4 + i(0)$$
  $\Rightarrow$   $r = \sqrt{4^2 + 0^2}$  and  $\theta = \arg(z) = \tan^{-1}(0/4) = 0 \Rightarrow 4 = 4 (\cos 0^\circ + i \sin 0^\circ)$ 

Using the formula (\*) above with n = 4, we can find the fourth roots of 4 (cos  $0^{\circ} + i \sin 0^{\circ}$ ):

For k = 0, 
$$4^{1/4} [\cos(0^{\circ}/4 + 360^{\circ}*0/4) + i \sin(0^{\circ}/4 + 360^{\circ}*0/4)] = \sqrt{2} [\cos(0^{\circ}) + i \sin(0^{\circ})] = \sqrt{2}$$

For k = 1, 
$$4^{1/4} [\cos(0^{\circ}/4 + 360^{\circ}*1/4) + i \sin(0^{\circ}/4 + 360^{\circ}*1/4)] = \sqrt{2} [\cos(90^{\circ}) + i \sin(90^{\circ})] = \sqrt{2} i$$

For k = 2, 
$$4^{1/4} [\cos(0^{\circ}/4 + 360^{\circ}*2/4) + i \sin(0^{\circ}/4 + 360^{\circ}*2/4)] = \sqrt{2} [\cos(180^{\circ}) + i \sin(180^{\circ})] = -\sqrt{2}$$

For k = 3, 
$$4^{1/4} [\cos(0^{\circ}/4 + 360^{\circ}*3/4) + i \sin(0^{\circ}/4 + 360^{\circ}*3/4)] = \sqrt{2} [\cos(270^{\circ}) + i \sin(270^{\circ})] = -\sqrt{2} i$$

Thus all of the complex roots of  $x^4 = 4$  are:  $\sqrt{2}$ ,  $\sqrt{2}i$ ,  $-\sqrt{2}i$ 

# Conics

## Circle

## **Key Formulas**

The **standard form** of a circle is denoted by the formula

$$(x - h)^2 + (y - k)^2 = r^2$$

#### Where

- → (h,k) = center of the circle
- → r = radius of the circle

## Ellipse

### **Key Formulas**

The standard form for horizontal major axis is given by

$$(x - h)^2 + (y - k)^2 = 1$$

The standard form for vertical major axis is given by

$$(x - h)^2 + (y - k)^2 = 1$$

Where

- → (h,k) = center of the ellipse
- → 2a = length of the major axis
- → 2b = length of the minor axis
- → 0 < b < a

The **foci** of the ellipse can be found using the formula  $c^2 = a^2 - b^2$  where c = foci length

# Hyperbola

### Key Formulas

The standard form for horizontal transverse is given by

$$(x - h)^2 - (y - k)^2 = 1$$

The standard form for vertical transverse axis is given by

$$(y - k)^2 - (x - h)^2 = 1$$

Where

- $\rightarrow$  (h,k) = center of the hyperbola
- → a = distance between center and either vertex

The **foci** can be found using  $b^2 = c^2 - a^2$  where

- c is the distance between center and either focus
- $\rightarrow$  b > 0

## **Parabola**

## **Key Formulas**

A parabola that is symmetric about a **vertical axis** is given by

$$y = a (x - h)^2 + k$$

A parabola that is symmetric about a **horizontal axis** is given by

$$x = a (y - k)^2 + h$$

#### Where

- $\rightarrow$  (h,k) = vertex
- → a = scaling factor
